

# Pneumonia

## Quality Indicators

Scientific research indicates the following seven measures represent best practice in the treatment of bacterial pneumonia (also called community acquired pneumonia). Mount Carmel data is for the time period July 2009 - December 2009. Ohio and national data is from the Hospital Compare website and is for the time period July 2008 - June 2009.

**Antibiotic Given at the Right Time**  
 % of patients given antibiotic within 6 hours of arrival at hospital

Early administration of antibiotics can cure bacterial pneumonia and reduce complications -- antibiotics should be received within 6 hours of arriving at the hospital

**Pneumonia Vaccine**  
 % of patients who were assessed and given vaccine if needed

The pneumococcal vaccine can prevent complications and future infections -- pneumonia patients should be given a pneumonia vaccination if they do not have one

### Influenza Vaccine

% of patients who were assessed and given influenza if needed

Influenza is a serious and sometimes deadly lung infection -- pneumonia patients, particularly those over age 50, should be given a flu vaccine if they do not have one

### Smoking Cessation Advice Given

% of pneumonia patients given smoking cessation advice or counseling

Smoking damages the lungs and increases the chances of getting pneumonia, emphysema and bronchitis -- patients should get smoking cessation information before leaving the hospital
